Better Eyesight

A MONTHLY MAGAZINE DEVOTED TO THE PREVENTION AND CURE OF IMPERFECT SIGHT WITHOUT GLASSES

January, 1926

The Period

THE perfect memory or imagination of a period is a cure for imperfect sight. Only the color needs to be remembered. The size is immaterial, but a small period is remembered with more relaxation than a large one. It is true, however, that with perfect sight, one has the ability to remember all things perfectly.

One cannot remember a period perfectly by any kind of an effort. It usually happens that one may remember a period for a time, and then lose it by an effort. To remember a period stationary, is impossible. One has to shift more or less frequently in order to remember one period perfectly all the time, or one has to imagine the period to be moving, or one has to remember the period by central fixation,—one part best. By shifting, is meant to look away from the period and then back, but to do it so quickly that it is possible to remember the period continuously, although you are not looking at it all the time,—this with the eyes closed. Every time you blink, you shift your eyes. You can blink so rapidly that it is not noticeable. When you close your eyes and remember a period, you cannot remember it unless you are, with your eyes closed, going through the process as though you were blinking, looking away from it and back again, but so quickly that it seems as though you were looking at the period continuously. You cannot remember the whole of the period at once. No matter how small the period is, you cannot see or remember it perfectly, all parts equally well at the same time. You cannot remember the period perfectly by any kind of an effort. When the memory of the period is perfect, the mental and physical efficiency is increased. A perfect memory of the period does not necessarily mean that one should think only of the period.

Swinging

By W. H. Bates, M.D.

Swinging: When the eyes move slowly or rapidly from side to side, stationary objects appear to move in the direction opposite to the movement of the head and eyes.

PEOPLE with normal vision are not always conscious of the swing. When called to their attention, however, they can always demonstrate it, and are always able to imagine all stationary objects to be moving. In imperfect sight, the swing is modified or absent. This is a truth which has been demonstrated over a long period of years by a great many people, and no exceptions have been found.

The normal or perfect swing is slow, short, easy and continuous. When the swing is normal, it is always true that not only is the vision normal or perfect, but also the memory, the imagination, or the mental efficiency correspond. When the memory is imperfect, the imagination, the mental efficiency, and the sight are also imperfect.

All cases of imperfect sight from myopia, or near-sightedness, become normal when the swing becomes normal. The same is true in cataract, glaucoma, diseases of the optic nerve and retina. For example, a woman, aged sixty-three, was treated for imperfect sight from cataract. Her vision was 10/200, and was not improved by glasses. For twenty years she had not been able to read a newspaper with or without glasses. In three visits, with the help of the normal swing, her vision improved to 10/10 minus, with flashes of normal vision, and she read diamond type at twelve inches rapidly without glasses. Other similar cases have been relieved as promptly.

It is important to understand how the swing can be imagined. Some people with mild cases of imperfect sight can imagine a letter or other object to be moving when they see or remember it perfectly. There are many others who fail. Severe pain, fatigue, or worry often prevent the demonstration of the swing. Blinking and palming are helpful in demonstrating the swing. The distance of the object regarded is important. The patient should be placed at a distance at which he can best demonstrate the swing. The distance varies with the patient.

It is unfortunate that many patients consider the swing complicated or impossible. However, they can usually demonstrate that a stare or strain lowers the vision. When holding a test card at a convenient distance from the eyes, patients may be convinced that the test card is seen better when moving. They may not profit by their experience, but continue to stare or strain, which always lowers the vision.

One patient was unable to imagine any kind of a swing. He was suffering from pain, mental depression, and imperfect sight for the distance. Reading the newspaper, even with glasses, was impossible. Since nothing he tried gave him any relief, I suggested that he stop trying to see and make no effort to imagine stationary objects to be moving. He practiced this while sitting in my waiting room. He paid no attention to the apparent movement of stationary objects, nor did he look at any object more than a fraction of a second. His vision after that improved from 20/50 to 20/10. He became able to imagine the movement of objects and demonstrated that all his pain and mental depression were caused by a stare or an effort to see all things stationary, when he regarded, remembered or imagined them. He was comfortable when he imagined objects moving or swinging, but very uncomfortable when he made an effort or imagined them to be stationary.

Recently, I tested the sight of a girl about ten years old. She read the Snellen card at ten feet with normal vision. She was asked: "Do you see any of the small letters moving from side to side?"

"Yes," she answered, "they are all moving."

"Now can you imagine one of the small letters stationary?" At once she quickly looked away and frowned.

"Why did you look away?" her father asked her.

She replied: "Because it gave me a pain in my eyes and head, and the letters became blurred." "Don't ask me to do it again."

The experience of this child is the same as that of everyone, young or old, with perfect or imperfect sight. When the sight is normal and continuously good, to try to stop the swing of a letter or other object necessitates a strain,—an effort which always lowers the vision and produces discomfort or pain in one or both eyes.

It has been repeatedly demonstrated that a letter or other object cannot be remembered or even imagined perfectly and continuously, unless one can imagine it to be moving or swinging. Not only does the sight become imperfect, but also the memory, imagination, judgment, and other mental processes are temporarily lost. These facts should be known to teachers, because they greatly affect the sight, the mental efficiency, and the scholarship of their pupils.

When the memory, imagination and vision are normal, the eyes, the brain and the entire nervous system are at rest. The reverse is also true, for when the muscles and nerves of the body are not at rest, the sight, memory and imagination are imperfect, and the mental efficiency is lessened or lost.

It is impossible to imagine pain, or any symptom of disease and the normal swing at the same time. Children with whooping cough have been immediately relieved by the relaxation obtained from the swing. Many patients suffering from severe attacks of bronchitis have been promptly relieved in the same way. Angina pectoris, pneumonia, triticial neuralgia, and other serious diseases have also been relieved after relaxation or rest was obtained with the aid of the swing.

The swing is generally beneficial. Some patients obtain more relaxation from one type of swing than from another. The long swing, however, is most helpful in a great many cases.

LONG SWING: Stand with the feet about one foot apart. Turn the body to the right, at the same time lifting the heel of the left foot. The head and eyes move with the movement of the body. Do not pay any attention to the apparent movement of stationary objects. Now place the left heel on the floor, turn the body to the left, raising the heel of the right foot. Alternate. Pain and fatigue are relieved promptly while practicing this swing. When done correctly, relief is felt in a short time. The long swing, when done before retiring, lessens eyestrain during sleep.

VARIABLE SWING: Hold the forefinger of one hand six inches from the right eye and about the same distance to the right. Look straight ahead and move the head a short distance from side to side. The finger appears to move in the direction opposite to the movement of the head and eyes.

DRIFTING SWING: The patient does not think of nor regard anything longer than a fraction of a second. It is helpful in doing this for the patient to imagine him-self floating down a river. He may be able to imagine the drifting movement of the boat in which he is floating, better with the eyes closed than with them open. In this case, alternate the imagination with the eyes open and with them closed. The imagination may be improved in this way.

SHORT SWING: When the sight is normal, one can demonstrate the short swing. When it is imperfect, one can demonstrate only the longer swing. When a patient with imperfect sight regards the Snellen test card at ten or fifteen feet, he may be able to imagine one of the letters on the card to be swinging a quarter of an inch or less. The imagination of a shorter swing always improves the sight. Some patients can imagine the short swing better with their eyes closed than with them open. Alternate the imagination of the swing of the letter with the eyes closed and with them open. By repetition, the vision of the letter with the eyes open will improve (at first in flashes, later more continuously), if the memory of the short swing is perfect with the eyes closed.

UNIVERSAL SWING: When the eyes are at rest, they are always moving. When the body is at rest, it can always be imagined, one part in turn, to be moving or swinging. The chair, on which the patient is sitting, is swinging. The floor, on which the chair rests, is also swinging. The walls of the room also swing when the floor swings. When one part of the building swings, one can imagine the whole building to be swinging. The ground, on which the building stands, is also swinging. When the ground swings, other buildings connected with it swing. One can imagine the whole city to be swinging, this continent and all other continents on the earth can be imagined swinging. In short, one can imagine not only that the whole world is moving, but also the universe, including the sun, the moon and stars. The practice of the universal swing is of the greatest benefit, for in this way one can obtain the maximum amount of relaxation.

Stories from the Clinic

No. 71: PARTIAL PARALYSIS OF THE THIRD NERVE

By Emily C. Liernan

GEORGE, aged five years, was sent to me by a physician, who diagnosed his case as paralysis of the third nerve of the right eye. A number of eye specialists said that he could not be cured. One gave him internal treatment for about six months and used electricity on the eye without much permanent benefit. When a nerve is paralyzed, its function is lost. In other words, the nerve is not able to bring about a contraction of the parts supplied by the nerve. To explain further, that branch of the third nerve distributed to the muscle which raises the lid had lost its function. In general, it has been believed for many years that a paralyzed nerve is relaxed. After many years of observation and experimental work, it was demonstrated that a paralyzed nerve was under a great tension. Treatment which relieved the tension and brought about a sufficient relaxation was a cure for the paralysis.

In Dr. Bates' book is an illustration of a patient with paralysis of the seventh nerve. One of the functions of the seventh nerve is to close the eyelid. When it is paralyzed, the eye remains open. Not only does the eye remain in this way, but the lips are separated. The patient is not able to close the lips sufficiently to whistle. By palming and swinging, relaxation is obtained,—the patient becomes able at once to close the eyelid, and to close the lips sufficiently to whistle. These cases of paralysis do not need electrical nor other stimulation. They are cured by rest. I believe that electricity is a valuable remedy, but it has lost much of its prestige by being employed in cases where it was not needed.

Georgie's mother has unusual intelligence, and she came to us confident we could relieve or cure Georgie's eyes. This is the history of his case as she described it: When he was born his right eye was wide open, and the child was unable to close the eye. About three months later the eyelid closed, and the child was unable to open his eye. Several eye specialists in Brooklyn told the mother that the eye could not be cured.

From the very beginning, Georgie was a source of pleasure to me. He seldom spoke above a whisper and preferred to go through each treatment without speaking at all, if possible. At such times he was given the card with the letter E pointing in different directions. When I asked him which way the E's were pointing, as I pointed to each one with my pencil he would say left, right, up, down. But if he were not in the mood, he would raise his hand and indicate the direction in which the E was pointing. In the beginning, this card was the only one used in his treatment, because he did not know all the letters of the alphabet. After he was admitted to the kindergarten school, he asked for the alphabet card, and also a figure card, which children favor a great deal for testing their sight. When Georgie's first test was made, he was unable to open his right eye. The left eye was normal, or 10/10.

I taught him to palm, and while he sat quietly, I began to talk to his mother. The conversation was solely for his benefit, so I talked about him. Like all mothers of her type, she praised her little boy and informed me of all the wonderful qualities of his mind, and that he was most obedient. I saw him smile, and for a moment he peeped a little through his fingers. After he had rested his eyes for ten minutes, I told him to keep his left eye covered, and look at the card with his right eye. His mother sat facing him, with her eyes wide open on his mind, as she saw the eyelid open just a trifle. He was able to keep his right eye open long enough to read 10/70, then the eyelid dropped again. His mother obtained a number of different Snellen test cards and used them at home for the daily treatment of the paralyzed eye.

I treated Georgie again, one week later, and I immediately had him practice the palming. So many patients have failed to palm successfully, because they stare even with their eyes closed. Georgie palmed successfully because, at my suggestion, he remembered the things that were pleasant and easy to recall. If I could not think quickly enough of a story to tell him, I would show him something in my room which pleased him. Then he would palm and describe it to me. At one time I showed him a box of bonbons, which were attractively arranged, and promised him some if he would sit and palm for a long-time. His mother and I were amused, because he was unusually quiet when he remembered the candy. After he had palmed awhile, I suddenly asked him what he was thinking about. He opened his eyes long enough to say the word "candy" and then closed them again. The vision of his right eye improved from 10/70 to 10/50 that day, and the eyelid was more open than before. The left eye improved to 12/10.

At every visit his vision was improved, while the paral-ysidiminished with the increased relaxation of his eye. I noticed that occasionally he would forget to blink, and then he would stare and strain, which lowered his vision and increased the paralysis. His eyelid has opened more, and his vision has improved since he became the owner of a little puppy. Whenever he played with the little dog, his mother noticed that both eyes would blink. This is evidence that things seen in motion are seen best. The vision of his right eye was improved to more than 10/10, while that of his left eye to 18/10, which is very unusual in a child six years of age. He had been under my treatment for about a year.

The Blinking Knight

By George M. Guild

INSIDE a dark, dingy, little shop, a group of children bent over their work. Outside, New Year's revelry echoed along the streets, but the day held no joy nor merriment for these little workers. It was just like every other day. It meant sitting from early morning until late at night stringing countless numbers of little beads together, to make ornaments. They stooped over their tasks until their sight grew dim, and colored spots danced before their eyes. They knew it stop their work nor rest for even a moment, but the angry proprietor prodded them on.

Today, fear and dread settled in the hearts of the poor children. Had they not been told that their work was very bad and that they would be dismissed? They knew it was, because they could not see to match the beads in the dull light of the shop. Perhaps glasses would help them, but where was the money to come from?

As evening approached, the light grew dimmer and dimmer. It seemed to the children that they could no longer go on, when from a dusty corner they heard a voice say, "Good evening, children." As they looked, they saw a light shining. The light grew stronger and stronger, and seemed to fill the room. The little workers almost shouted aloud with joy. Suddenly a little man with a flaming sword jumped out to the center of the room. On his head he wore a soft velvet hat with a very large brim; a cluster of huge diamonds shone on the front, while smaller ones covered the hat band. His coat had a long tail, which swayed with every movement he made. The many glittering buttons were immense diamond discs. His yellow vest, which contained a great many more pockets than any vest the children had ever seen, was decorated with diamonds, rubies, emeralds, and sapphires. His violet trousers reached only to his knees, and they, too, were covered with jewels. He wore long stockings of fiery red, and his low patent leather shoes were trimmed with large silver buckles. The belt of the scabbard for his sword sparkled with jewels.

When the children gazed on this knight, they became very quiet and curious to know who he was. His eyes were sympathetic as he smiled good-naturedly on them. When he spoke, his voice was like music to their ears and made them all feel comfortable and at peace with the world. "Children," he said, "the fairies have sent me to help you to be happy. I love each and every one of you and want to cure your eyes, so that you will be able to have perfect sight all the time. You will be able to see even in the dimmest light without glasses. All of you are working too hard. Make believe that you can see fairies, that you can talk with them, dance with them, and be like them. When I was a boy, I wanted to be a fairy, but when I grew up, the king made me a knight and sent me out into the world to slay as many bad people as I could. I was very skillful at doing this.

"One day, while riding through a wood, I saw some blue flowers. They were so beautiful and fragrant that I said aloud, 'Oh, you lovely blue flowers, how I wish you were all fairies,' and then, much to my surprise, every flower turned into a blue fairy. They climbed upon my steed and urged him to canter as fast as he could. Very soon we came to a field of beautiful yellow flowers. While I looked at them, entranced, myriads of little yellow fairies danced gaily from the petals and mingled and danced together, leading us on, until we reached a meadow of violets nodding in the breeze. They were even more beautiful than the others. I wished that they too were fairies. All at once the violets turned to violet fairies and they frolicked with the other fairies."

The knight ceased to speak for a moment and then suddenly held up a bouquet of blue, yellow and violet flowers. The children saw him leap to the middle of a large table in center of the room. There he began to dance, and as he danced he blinked his eyes and waved the flowers around his head, crying out to the children, "Make believe that these flowers are fairies. Remember the colors perfectly. Blink your eyes as you see me blinking, and never forget what you will see now." Immediately the flowers all turned to fairies of the same color.

At once they all began to dance around the blinking knight, laughing, shouting, and enjoying themselves. The knight touched each child in the shop with his wonder-ful sword, and each child as soon as she was touched, turned into a fairy. Some blue, some yellow, and some violet, and all

blinking as frequently as the blinking knight.

"Now that you are all fairies," he said, "you must think, remember, imagine, and believe all things which are good. Tomorrow morning, you will all waken and believe that all this was a dream. I want to tell you that I was born a thousand years ago. I speak with the wisdom of the ages when I say to you, that if you will only remember me and make believe that you are fairies, you will always be happy and good the rest of your lives."

How Estelle Helped

By Beatrice Smith

THERE are many cases of imperfect sight, many cases of pain and fatigue, which can be cured by other patients who have obtained normal sight without glasses by practicing relaxation methods.

About three years ago, a young man, aged seventeen, suffered very much from pain in his right eye. The pain increased quite rapidly and finally became so severe that in order to get any relief, he was compelled to take morphine. As time passed, the dose of morphine was increased and increased with unusual rapidity. The outlook seemed dismal. The eye specialists in some of the large cities prescribed glasses for him, but without benefit. One day while walking along the street, he met a lady whose daughter had been cured by the treatment of imperfect sight without glasses, discovered and practiced by a physician living in New York City. The lady recommended him to practice palming, swinging and some other methods described in a book called Perfect Sight Without Glasses. The palming gave instant relief. By palming for fifteen minutes every night and morning, the pain was relieved or prevented. This treatment was continued for some months, usually about three times daily for fifteen minutes each time. As the days went by without a return of the agonizing pain, he practiced palming less frequently, until after three months, not having had an attack of the pain, he stopped the palming and forgot all about his right eye.

The patient lived in one of the large cities of the West. It was interesting to learn of the great number of people who followed the treatment of this case of pain and kept in mind all the particulars. When the boy began to lessen the number of treatments by palming, some of his friends were very much concerned for fear that he was stopping the treatment too soon. When he remained free from pain for some time, they were relieved, but still more or less apprehensive. I believe the boy felt deep down in his heart that if that pain ever came back, he would know how to handle it.

The patient, who recommended the boy to palm, had a daughter about ten years old, who had been to New York, taken the treatment and been cured of imperfect sight without glasses. This little girl kept after the young man in the early days of his treatment and insisted that he practice all those methods, which were beneficial, repeatedly and continuously. I believe it was the efforts of the little girl, which did more than anything else to benefit the patient. True, he was willing to palm and did palm, but there were days when he would forget and she kept after him until he was cured.

I believe that she had more to do with the cure of the boy's pain than did the supervision of other people.

A Student's Experience

By Margaret Robinson

AUTHOR'S NOTE—Dr. Bates has asked me to send some report in regard to my teaching of his methods in Bloomington, Illinois. Converts to the truth of Dr. Bates' explanation of eye troubles are persuaded that glasses, for the average person, are unnecessary, also, that the vision is lowered as a result of their use. It is appalling to find how many people are actually struggling with glasses, which, they have been told, would relieve it strain and save their vision. If, in my very limited experience I have found so many of this type, there must be a great number of such unfortunates in every community. The three following cases illustrate what I mean:

MISS L., age thirty, had worn glasses since she was ten years old. In the past two years, since a cataract operation, she said she had visited the oculist at least once a week. He had changed her glasses four or five times during this period, had stopped all reading, and was putting medication in her eyes to relieve a distress, which she said was almost constant. He seemed uncertain what to do next, as her vision was steadily growing worse. With her glasses she read 10/30 with both eyes and 10/200 with the right eye alone. After taking off her glasses and palming for a short time she read better than 10/20 with both eyes, and almost 10/70 with the right eye. The near vision of the right eye was also impaired. On the first day, she could not read ordinary type with this eye alone. In two weeks she lost all sense of strain and read 10/10 with both eyes and began to read 10/50 with the right eye. She read diamond type readily with both eyes together and slowly with the right eye alone, at six inches. She reported, that she was able, without fatigue, to read two hours or more at a time, day or evening. She looked and acted ten years younger.

Miss J., age forty-two, was very much frightened about her eyes, and very loath to give up the large glasses behind which her eyes looked so tired and drawn. She had been forced to give up her position at an embroidery counter because of the failure of her vision. In eight months she had had three different pairs of glasses, and said that the oculist told her frankly that he was much puzzled as to how to relieve her very serious strain. Four lessons, with her intelligent co-operation, and less than a month's time, relieved the situation. Her eyes were comfortable and she was able to see satisfactorily for reading and sewing, as well as at a distance. The look of relief on her face was very gratifying.

Mrs. W., age forty-nine, had suffered with very severe eye difficulties for twenty years. She had been forced to give up her piano work, could do practically no reading, and said, in fact, that many of the interests of her life had been dropped because of her eyes. Bright lights, and use of her eyes for close work, produced a sharp pain in her head which she had learned to greatly dread. Said for about a year she was allowed to use "very strong" glasses ten minutes at a time. Of late she had used them longer than that, but it made her eyes very tired to do so. There were dark rings under her eyes and she was very nervous. Without her glasses she was able to read 10/15, also large clear type at reading distance but better at arm's length. She did this, however, with fear and trembling, often stopping to close her eyes. In two weeks, she was reading 10/10 readily without fear, also getting flashes of clear vision when practicing with the diamond type card held at six or eight inches from eyes. She was comfortable, had lost all dread of bright lights, did not get the pain in her head any more, and was losing the dark rings under her eyes. She stopped taking lessons at this point, but continued to improve, according to reports which reached me several months later.

In each of these cases, glasses were not only useless, but actual torture. In each case the individual had given up what she wanted to do because of her eyes. In each case a couple of weeks without glasses, combined with learning how to relieve the eye strain, made life, as each wanted to live it, possible. It seems incredible that the value of such facts is not more quickly and more generally accepted.

## Questions and Answers

Question—I can read with no trouble but cannot distinguish things at a distance, especially the features of people. What would you suggest?

Answer—You are near-sighted. The imagination cure is the quickest and most satisfactory cure of myopia. Use two Snellen test cards, one held at one foot or nearer, or at a distance where you can see it best; the other placed at five feet or further. Look at the first letter of one of the lines of the near card and with the eyes closed remember it for half a minute or longer. Then look at the same letter on the distant card at five feet or further and imagine that letter for not longer than a second. Then look at the near letter again for part of a minute, close your eyes and remember it, and then glance at the same letter on the distant card for not longer than a second, and imagine it as well as you can. Alternate. When you become able to see the bottom line on the distant card, place it a few inches further off and repeat.

Question—What method is most helpful in myopia?

Answer—Palming, swinging, and the use of the memory or imagination (described above), are most helpful.

Question—Can you tell me what to do for inflammation of the white of the eye? Do you think sun gazing would help?

Answer—The light treatment is beneficial. Sit in the sun with the eyes closed and let the sun shine directly upon the closed eyelids. Move the head a short distance from side to side. Practice this for half an hour or longer three times daily when possible.

Question—Will you kindly tell me what I can do in order to read as well with the eyelids fully open as I can when they are slightly parted?

Answer—Improve your vision with the aid of the imagination cure as described above in answer to question 1. When your vision improves, your eyelids will be more open.

Question—Is there any exercise or any particular, method of relaxation that will help double vision?

Answer—Closing the eyes and resting them is a cure for double vision. Blinking frequently, just as the normal eye does, is also beneficial.

Question—Please explain the elliptical swing.

Answer—In the elliptical swing, the head and eyes are moved continuously in the orbit of an ellipse or a circle. 'he continuous movement of the head and eyes prevents staring or strain, since staring requires that one try to keep the eyes from moving.

Question—How many times a day should the sun treatment be given?

Answer—The sun treatment should be given for half an hour or longer three times a day, or more often, when possible. The more sun treatment, the better, as it rests and strengthens the eyes.

Question—What treatment helps most people?

Answer—Palming is generally most helpful.

Question—Is it possible for some people to be cured by the help they may obtain from your book "Perfect Sight Without Glasses"?

Answer—Yes. By practicing the methods recommended in my book, many readers have improved their vision without my supervision. It helps to have some one with perfect sight supervise your treatment.

Question—Is myopia hereditary?

Answer—No. It is, however, contagious in many cases. When parents are cured of myopia, their children may recover without treatment.

Question—How long does it take to cure an average case of myopia?

Answer—Some patients are cured more quickly than others. The length of time is uncertain, as patients differ in their response to treatment.
