HOW TO ORTAIN PERCEPTION OF LIGHT IN BLINDING

Two things have always brought perception of light to blind patients. One is palming, and the other is the swing. The swing may take two forms:

1. Let the patient stand with first apart, and except the body, including the head and eyer, from side to side, while shifting the weight from one foot to the other.

2. Let him move his hand from one side to the other in front of his face, all the time trying to imagine that he sees it moving. As soon as he becomes able to do this it can be demonstrated that he mally does see the movemen

In palming, the patient should remember that this does not bring nilief unless mental relaxation is obtained, as evidenced by the disappearance of the white, gay and other colors which most blind people see at first with their open closed and covered
